

A 3D simulation of a port terminal. The scene shows a large industrial facility with several large cylindrical storage tanks, a long pier with multiple cranes, and two large cargo ships docked at the pier. The background is a dark blue sky, and the foreground is a dark blue water surface. The overall aesthetic is technical and industrial.

portwise®

Simulation & Bulk Terminal Performance

Javad Mohajeri

July 2024 | Portwise®

Portwise is a TBA Consultancy B.V. brand

Our 25+ years expertise and worldclass tools ... ready to future-proof logistics

Portwise uses state-of-the-art models, tooling, and expertise, to design smarter, more efficient and more sustainable ports and terminals for future-proof logistics around the world.

Harness the true potential of terminals

Data driven decision-making for dry bulk, general cargo and multi-purpose terminals

Understand the impact of decisions without the burden of cost and uncertainty of implementing wasted resources

Improve

Terminal Performance

Simulation & Bulk Terminal Performance Outline

- Why and when to start a simulation study
 - Design | Expansion | Optimization
- Modelling possibilities
 - Waterside | Storage | Internal transport | Gate | Hinterland
- Debottlenecking case study with real-world examples
 - Grab-crane | Internal transport | Storage

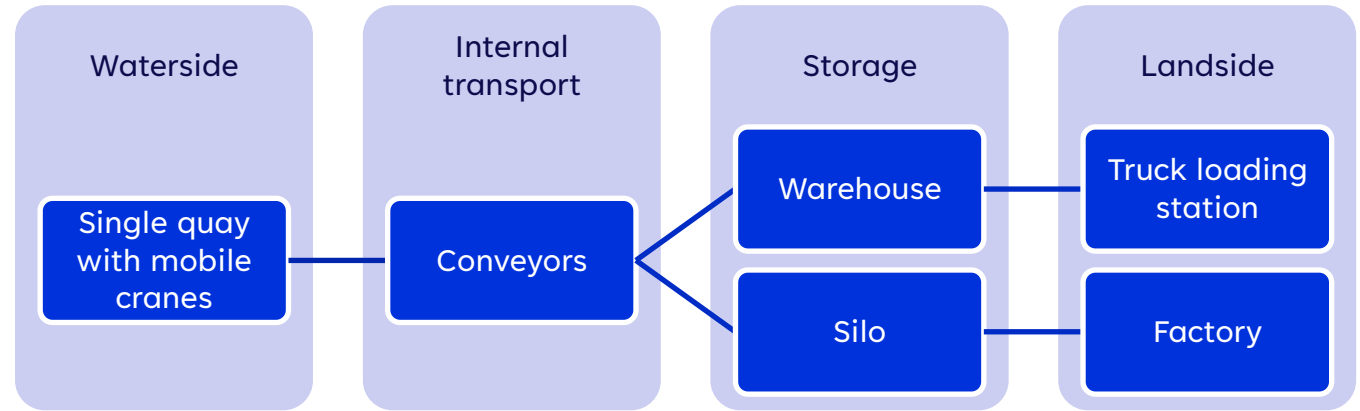

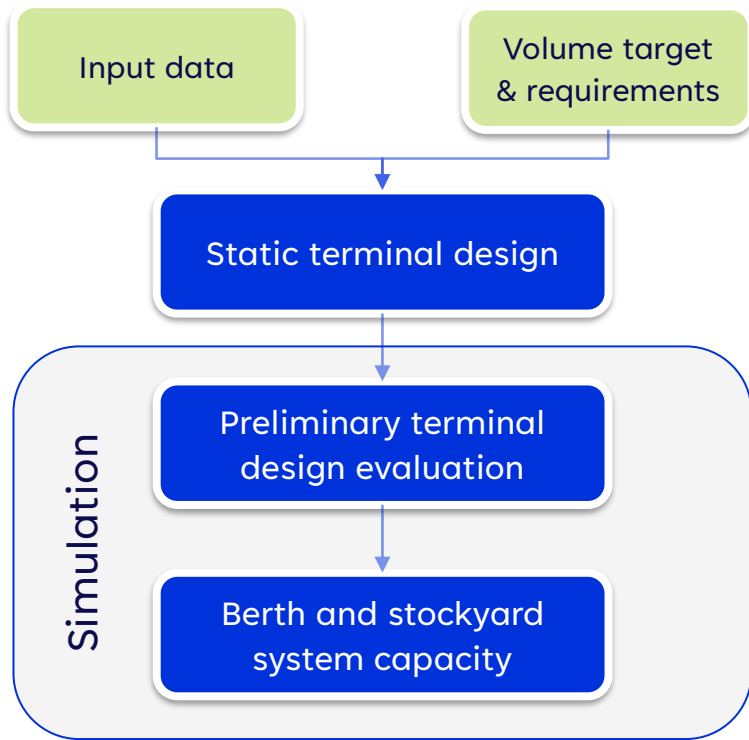

Why and when to start a simulation study

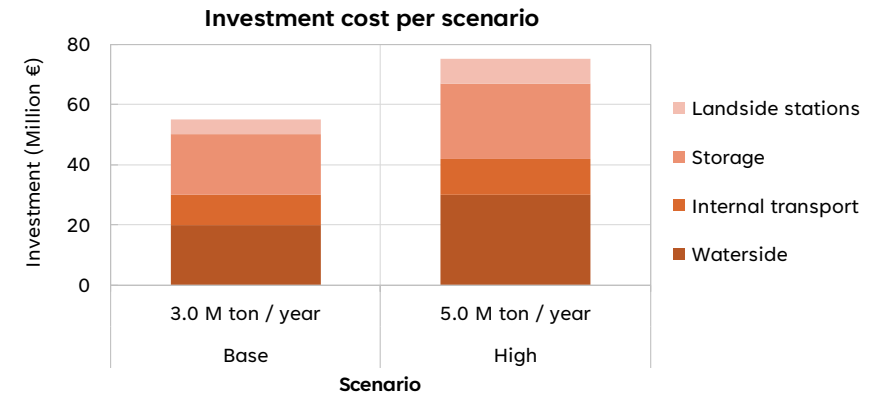

Design and expansion studies

Static terminal design (example)

1. Layout, logistic process, equipment

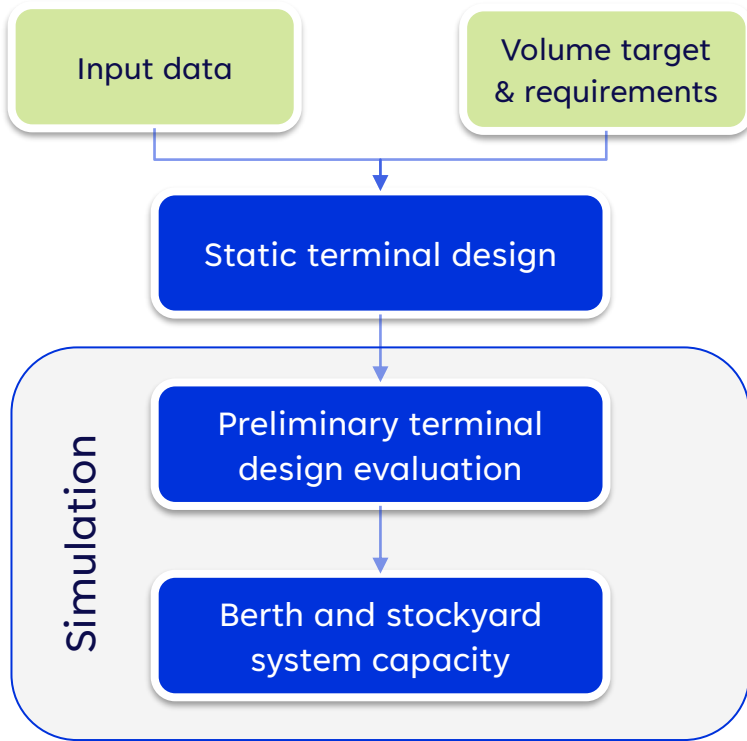

2. Investment, technical and operational evaluation

Why and when to start a simulation study

Design and expansion studies

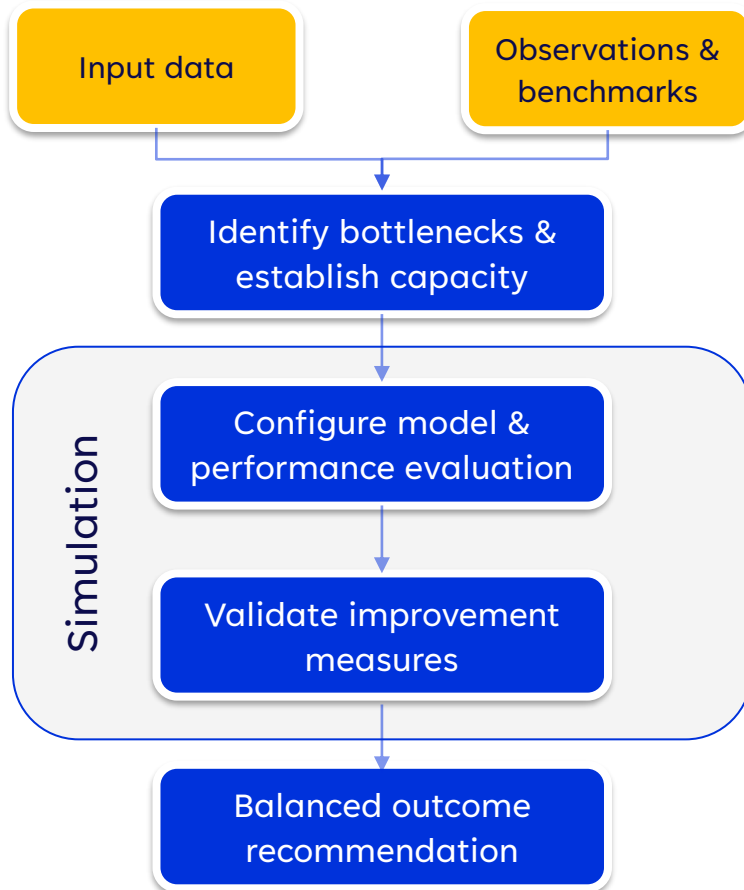

Dynamic simulation (example)

Why and when to start a simulation study

Optimization and debottlenecking studies

Identify bottlenecks (example)

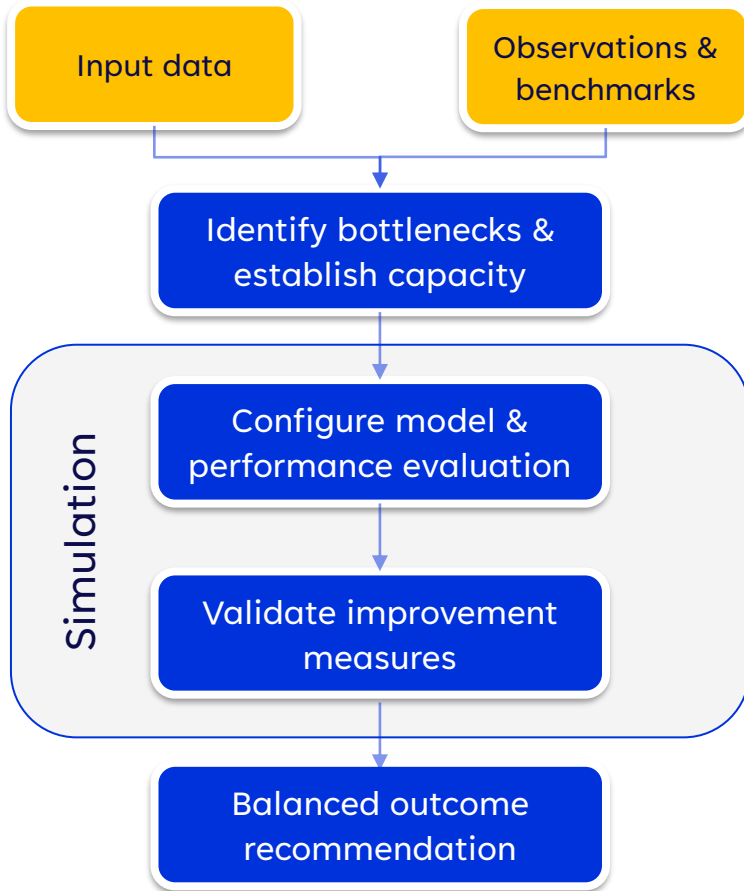

- Frequent delays
- Low filling rate
- Congestion

- Not possible for weather sensitive cargoes
- Additional handling cost

Why and when to start a simulation study

Optimization and debottlenecking studies

Identify bottlenecks (more complex example)

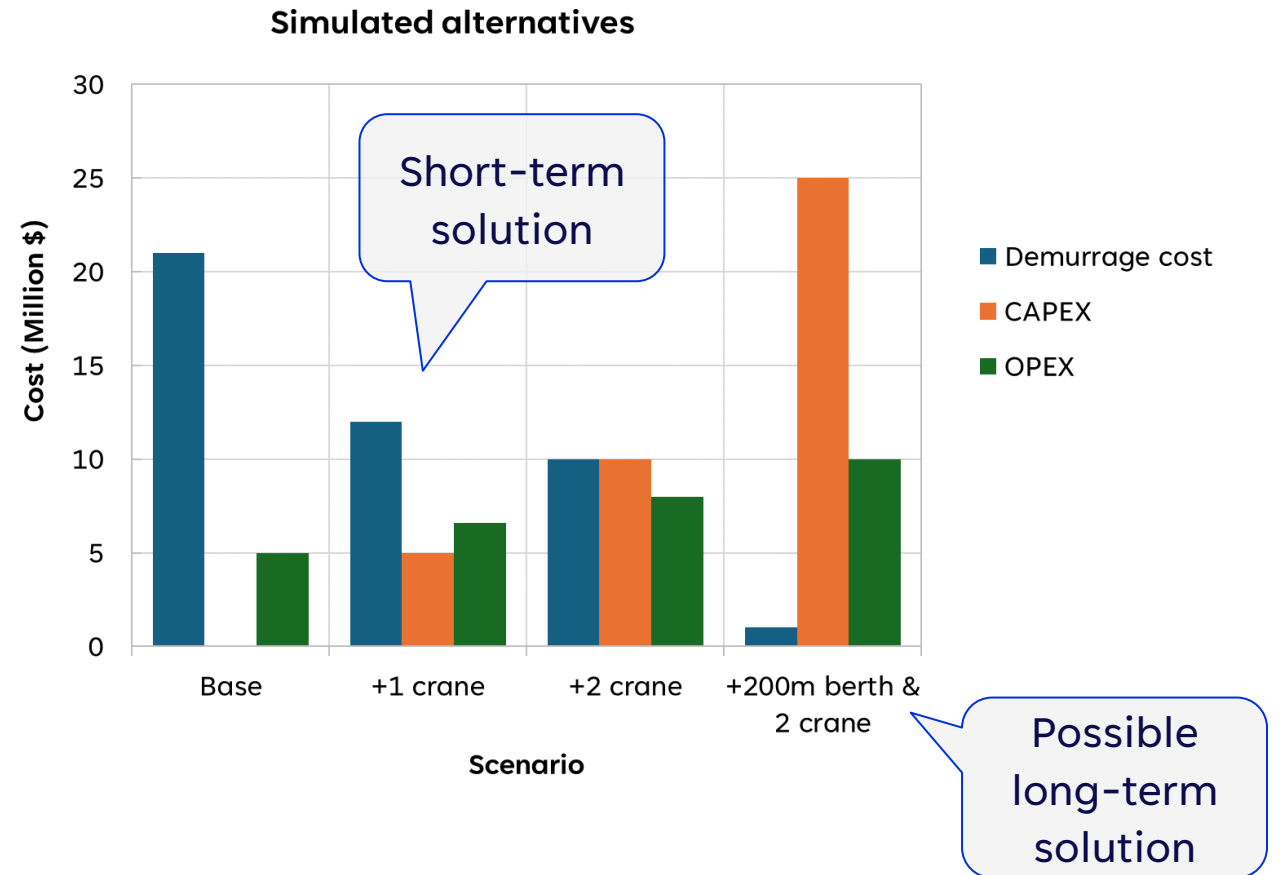

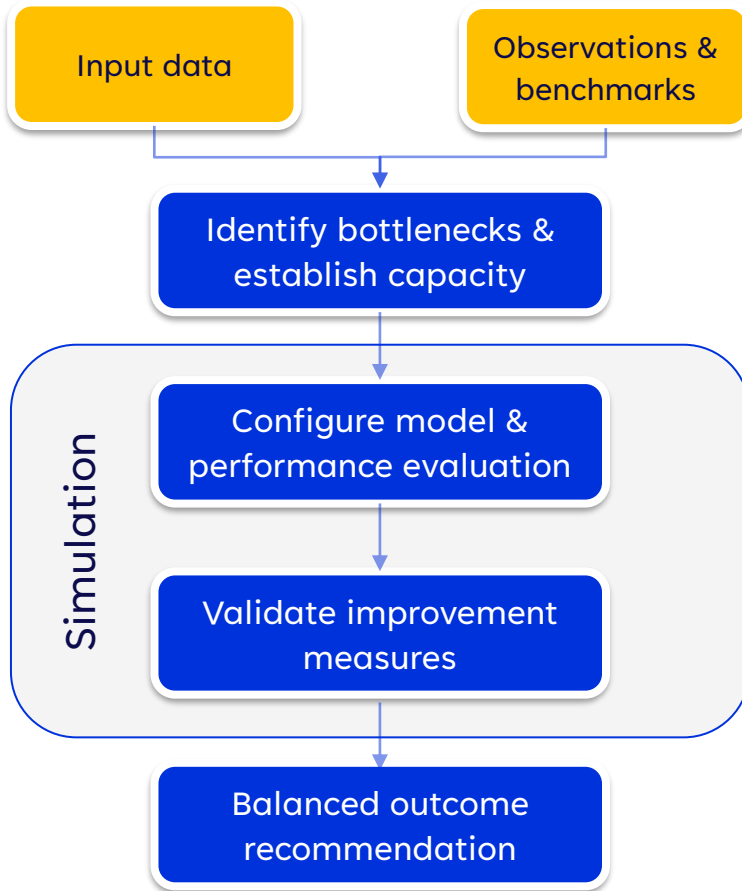

Demurrage, berth occupancy, and downtime

Why and when to start a simulation study

Optimization and debottlenecking studies

Dynamic simulation (example)

Simulation components – with examples of input and output parameters

Vessels

Schedule, call size, cargo, RTA, draft

Berth

Length, crane ranges, mooring rules

Equipment

Cranes, productivity per cargo, maintenance

Operators

Gang size, shifts, breaks

Environment

Tide constraint, weather stoppage

Planning

Crane and operator deployment, service levels, priority of vessels

Berth simulation (dry bulk)

Vessels

Service time, waiting time, demurrage cost

Berth

Occupancy per berth, realized schedule

Equipment

Working hours, efficiency

Operators

Working hours, required operators per shift

Environment

Energy consumption

Planning

Deployment frequency, workload distribution

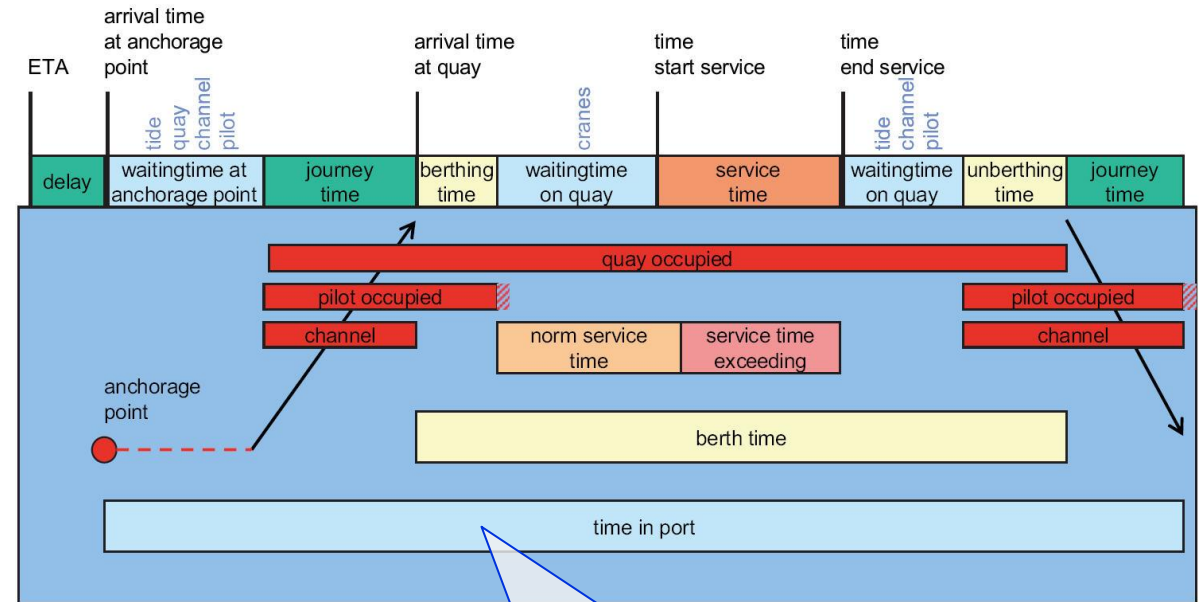

2D simulation model integrates major parts, incl. trucks, storage, conveyors, (un)loaders of a bulk terminal

Realistic vessel process → Realistic KPIs

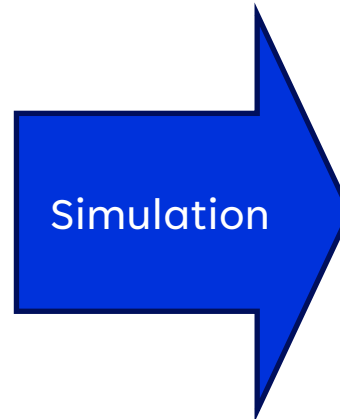

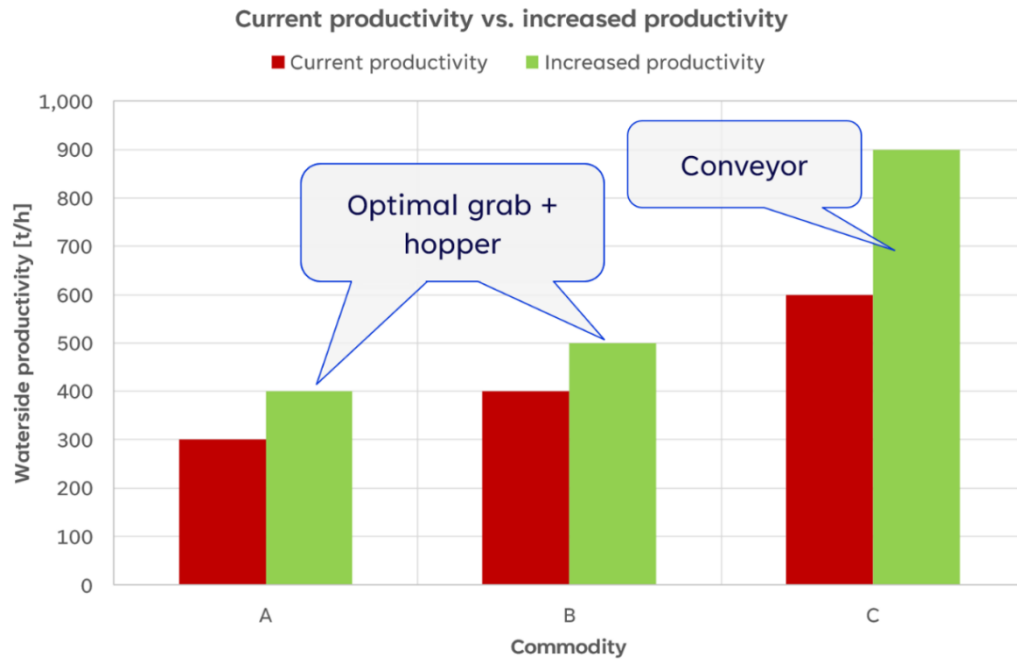

[Video: Unloading operation](#)

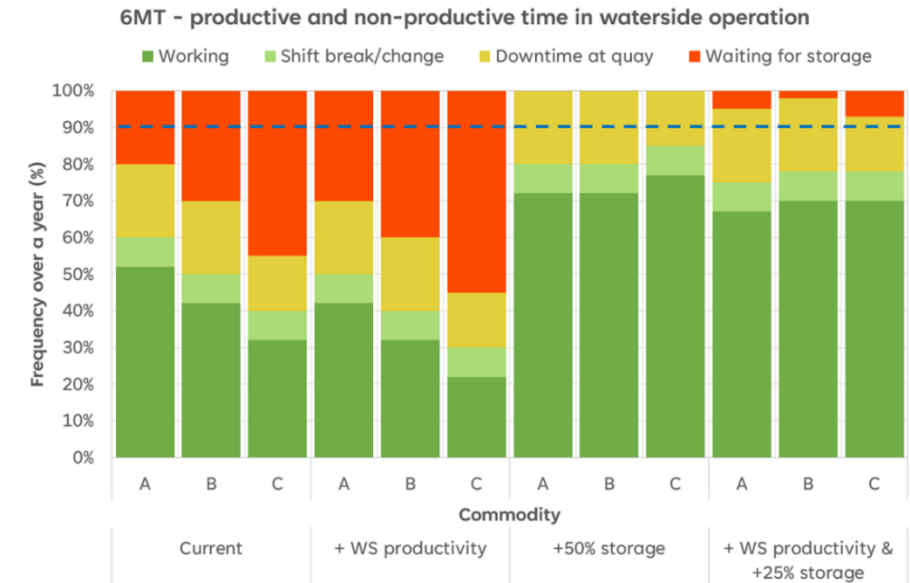

Ship owner and terminal operator have different perspectives

Case study: Increasing volume 4.0 → 6.0MT Equipment & bulk terminal simulation

- Improvements must be made in an integrated way, considering waterside, internal transport, and storage operations.

✗ ✗ ✓ ✓

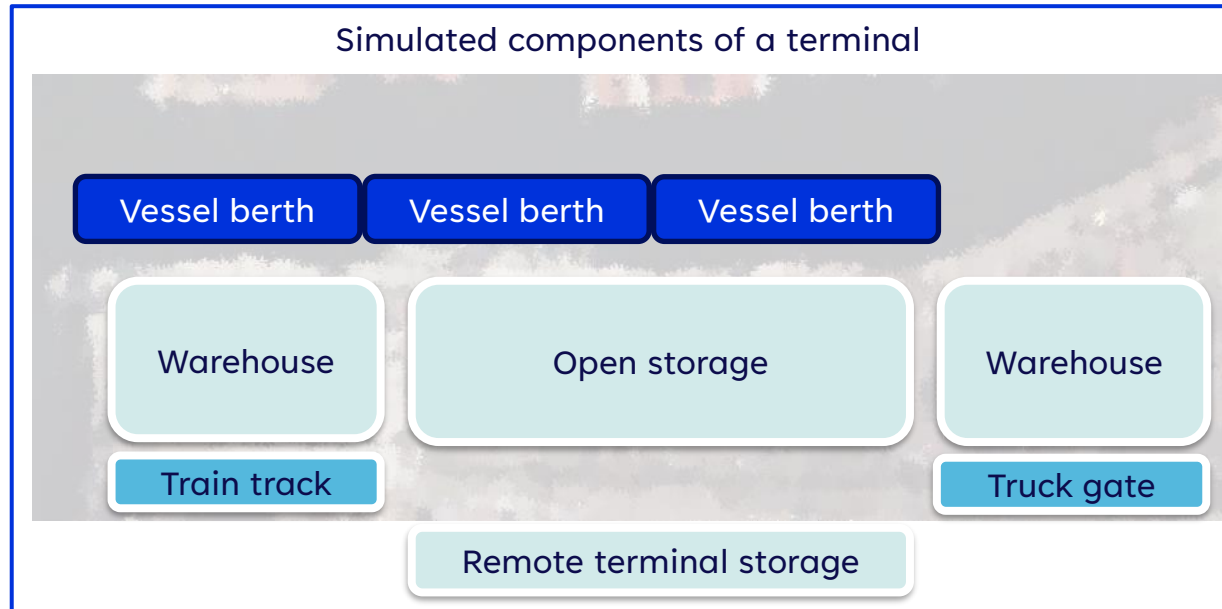

✗ ✓ ✗ ✓

Real-world example

100% increase in throughput, using the same quay

Type: Import
Cargo: Various
Size: 4.0 MT

- Identified bottlenecks → Observation, data analysis, simulation
- Crane-grab systems → Upgrade to optimum equipment
- Delays of internal transport → Proper maintained hoppers, larger trucks
- Storage issues → Design additional storage capacity
- Validated improvements through simulation
